

Scale Yourself Report: Trading Engine

Short Summary

Prior to this engine, I used a paid platform called FXReplay to conduct all my backtests for optimizing and collecting "data" on my strategies. On this platform I would manually rewind the price action on a chart, replay it bar by bar and record trades manually. Totalling over ~30 hours, I managed to collected about 667 trades worth of data. I used Claude Code and Codex to help turn that workflow into a repeatable futures research system: strategy configs, saved backtests, experiment tracking, research notes, TradingView parity work, execution plumbing, and dashboard review all living in one loop.

Backtesting Scale: Manual vs Engine

Trades reviewed manually vs simulated trades saved by the research engine

Manual dashboard

AI-built engine

752x more trade observations
501,801 saved simulated trades compared with 667 manually reviewed trades.

Manual stats from user-provided dashboard screenshot; engine stats from backtesting/data/results/experiments.db.

Key Metrics

- 225 commits across the measured window.
- 622,999 total changed lines recorded by git numstat.
- 1,419 saved backtest runs in backtesting/data/results/experiments.db.
- 501,801 simulated trades represented by those saved runs.
- 752x more saved simulated trade observations than the 667 manually reviewed trades shown in the dashboard screenshot.
- 4 saved optimization records, covering 1,284 parameter combinations.
- 226 tracked long-form research reports under backtesting/learnings/reports/.
- 268 tracked learning-memory Markdown files under backtesting/learnings/.
